Glossary

Baleen - The comb-like plates that hang from the upper jaws of large (baleen) whales such as the blue and humpback. It is used to strain the tiny fish and other creatures that these whales feed on, such as krill.

Blow - Water that is exhaled when whales breathe out.
the whales head. Baleen whales have two, toothed whales and dolphins only one.

Blowhole - A whale or dolphin's 'nostril' on the top of their head.
Baleen whales have two, toothed whales and dolphins only one.

Blubber - The layer of fat beneath the skin which keeps whales and dolphins warm.

Glossary

Breaching - is an activity in which the whale jumps fully or partially out of the water and then slaps the water loudly when coming back down. Sometimes they twirl around while breaching.

Calf - A baby whale.

Krill - The small shrimp-like crustaceans which are the main food of some baleen whales.

Mammal - Animals that are born alive, drink milk from their mothers, breathe air, have hair or fur, are warm-blooded. Whales are mammals.

Migrate (migratory) - Travel great distances. Move from place to place.

Pod - A group of whales that swims together.
